

Data Quality Engine (DQE) App

Local Setup Guide — download and run the app on your own machine

What you need first

- A Mac, Windows, or Linux computer
- **Python 3.9 or newer** installed — check by opening a terminal and running `python3 --version`. If it's missing, download it from python.org/downloads
- **Git** installed — check with `git --version`. If missing, download from git-scm.com/downloads
- Your Oracle OHIP credentials for the hotel(s) you'll be working with (Server URL, Hotel ID, App Key, Client ID/Secret, and Enterprise ID or a username/password) — you'll enter these inside the app itself, not during setup

No API keys or configuration files are required to get the app running — everything below is entered inside the app after it starts.

Step 1 — Download the app

Open a terminal (Terminal on Mac, Command Prompt or PowerShell on Windows) and run:

```
git clone https://github.com/tylerlinton-png/Data-Quality-Tool-.git
cd Data-Quality-Tool-
```

This downloads the app into a new folder called `Data-Quality-Tool-` and moves you into it.

Step 2 — Set up a Python environment

This keeps the app's dependencies separate from anything else on your machine.

```
python3 -m venv venv
source venv/bin/activate
```

On Windows, use this instead for the second line:

```
venv\Scripts\activate
```

You'll know it worked when you see `(venv)` appear at the start of your terminal prompt.

Step 3 — Install the required packages

```
pip install -r requirements.txt
```

This installs Flask (the web server), pandas, openpyxl, and the PDF-parsing library the app depends on. It only needs to be done once per computer.

Step 4 — Run the app

```
python3 app.py
```

Leave this terminal window open — it's running the app's local server. You should see output ending in something like `Running on http://127.0.0.1:5055`.

Step 5 — Open it in your browser

Go to:

```
http://localhost:5055
```

You'll land on the credentials screen. Enter your OHIP Server URL, Hotel ID, App Key, and login details, then click **Validate Connection**. Once it connects, the three actions below it unlock — Upload DVA & Compare, Pull Bookings/Blocks/Folio, and Pull Deployment Info.

Stopping and restarting the app

- To stop it: click back into the terminal window and press `Ctrl+C`
- To run it again later, you only need Steps 2 (activate, not create) and 4:

```
cd Data-Quality-Tool-  
source venv/bin/activate  
python3 app.py
```

Getting the latest version later

If updates are pushed to GitHub after you've already set the app up, just pull the changes and restart:

```
cd Data-Quality-Tool-  
git pull  
source venv/bin/activate  
pip install -r requirements.txt  
python3 app.py
```

Notes

- The app remembers whichever OHIP credentials you last validated (locally, on your machine only) so you don't have to retype them every time — it does not share this between different people's computers.
- It creates a small local database file the first time you run it — this stays on your computer and is never uploaded anywhere.
- If port 5055 is already in use, quit whatever else is using it, or ask engineering for a one-line change to run it on a different port.
